

# DITCH WORK & FLOOD CONTROL

Ditch and culvert work is necessary for a variety of reasons. Sometimes erosion brings in excess soil which must be removed. Construction projects may require culverts to be modified. Ditch work and flood control are regular components to grade stabilization projects as well.

Whatever your needs for flood control and ditch or culvert work, Hulcher Services can support your project.

Our excavator / vibratory hammer pile driver is the perfect solution to stabilize eroding soil on embankments, in creek beds and around bridge headwalls. Our hi-rail grapple trucks and wheel loaders often support the vibratory hammer, delivering piling, fill dirt or rip rap to complete the project.

Our excavators, dozers and dump trucks perform a variety of excavation and construction of drainage systems.

Hulcher brings the experience, professionalism and qualifications to ditching / flood control projects that no other contractor can match. Our crews have been background checked, trained and certified to work for all Class 1 Railroads so they are safe and qualified to work along the right-of-way. We are approved for operations within 25 feet of the track and the exclusion of working within 25 or 50 feet of the railroad has been removed from our insurance policies.

As you program your ditch maintenance work, call Hulcher at 800-637-5471 to learn more about our superior excavation, stabilization and flood control support.
